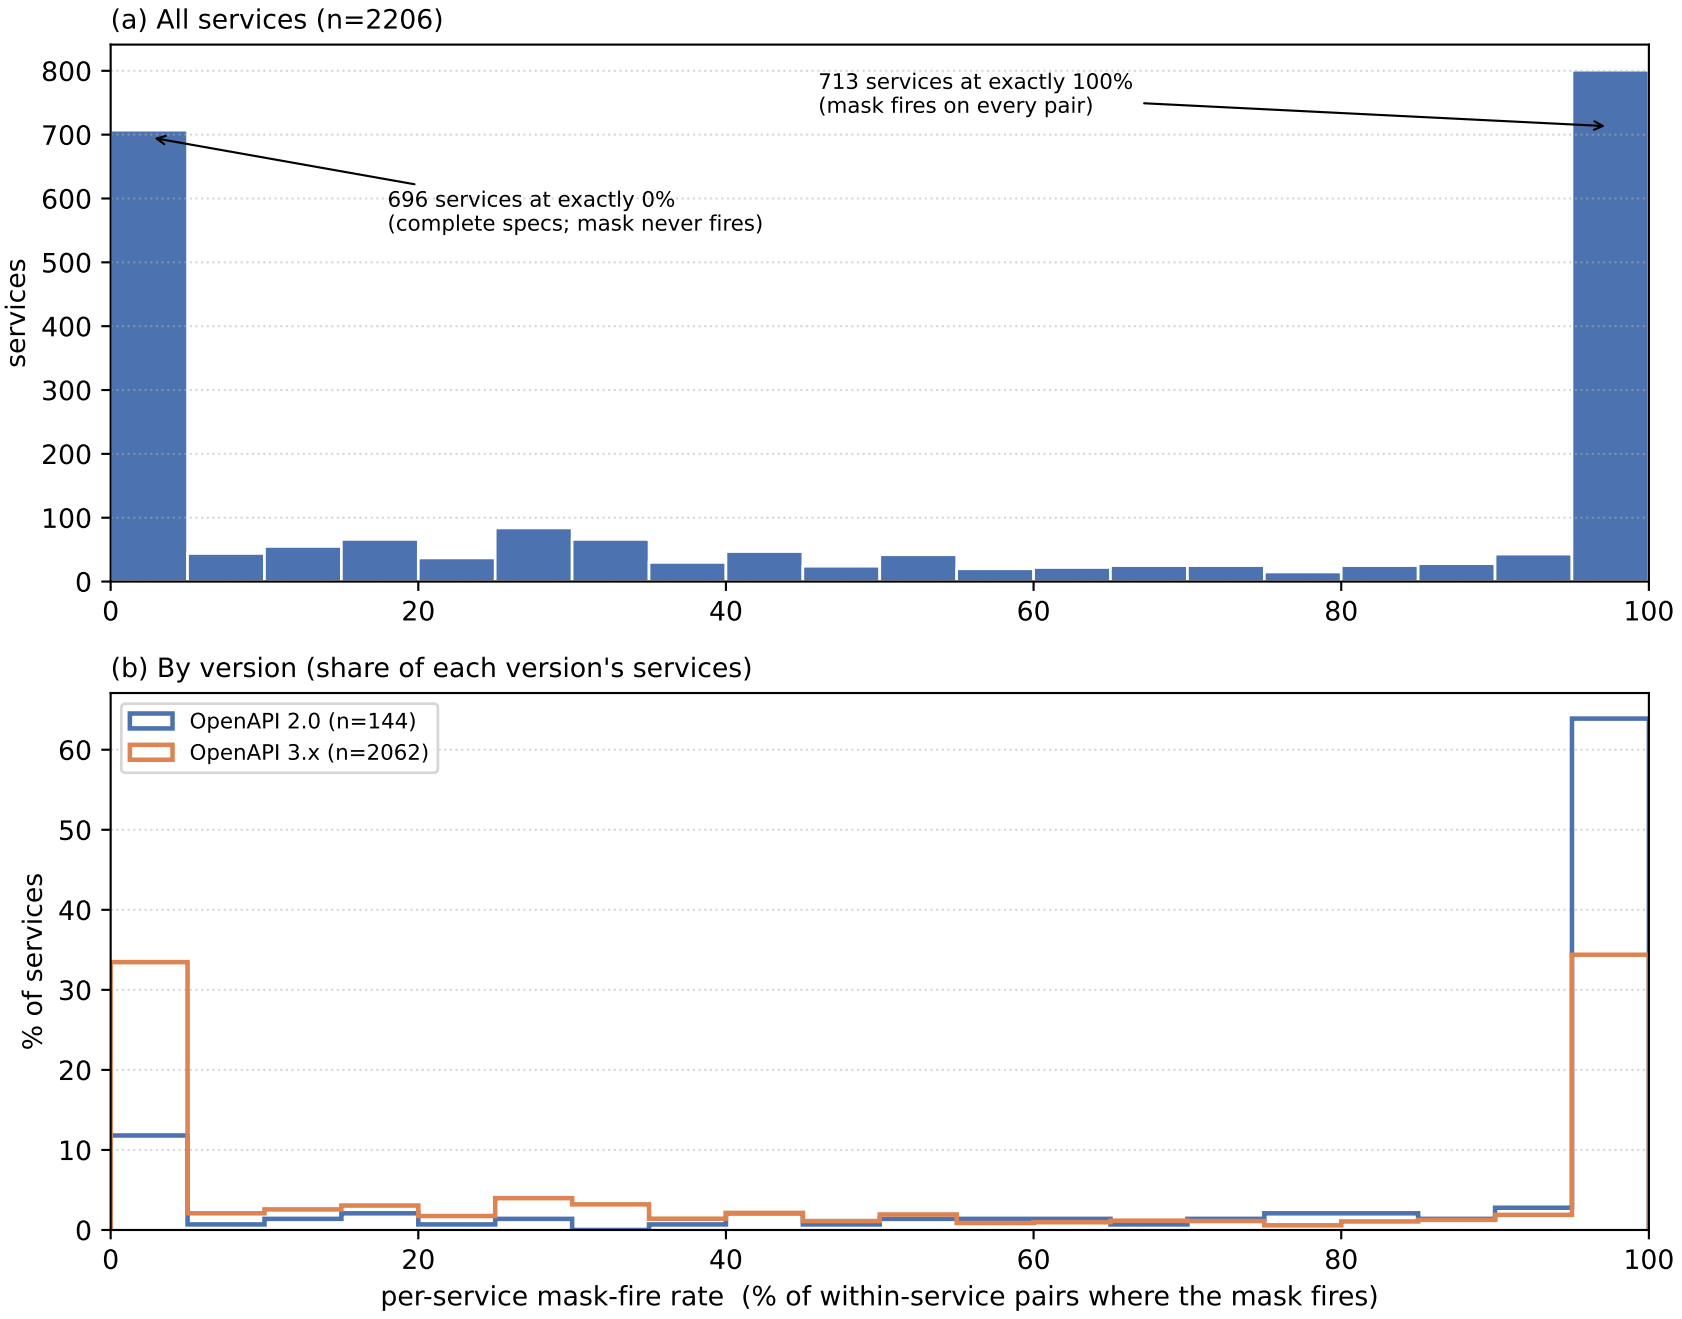
Fig 2 — Mask-fire rate is bimodal across services (f2 = codegen)



Per-service % of within-service pairs where at least one of f2,f4,f5,f6 is unavailable (the mask fires). Bins of 5 pts; the leftmost bar is dominated by services at exactly 0% (complete specs), the rightmost by exactly 100%. The bimodality is the point: report 'the mask matters for 66.9% of services', not the 48.6% mean.
